The options section opens up exactly like in Firefox, allowing you to alter the browser's behavior and looks, configure the search engine, manage content and notifications, and configure privacy and security-

related settings. The dossier, which The Times says will be made public on Thursday, was submitted by several European intelligence agencies to the British security services as part of an effort to persuade London to enact stricter legislation relating to the secret gathering of communications. The Times said a leaked CIA cable that purportedly summarizes the

dossier includes detailed information about US attempts to access and hack foreign computer systems, as well as specific requests made to the British government for help in locating a suspect. According to the Times, the information also shows that US agents have exploited a loophole that allows people to use a proxy server and mask their true identities in an effort to avoid detection by intelligence agencies. The new finding challenged an assumption which dates back to the beginnings of the scientific revolution. Scientists have found that baby dinosaurs were eating milk. This was previously assumed to be a human-only invention, but our research indicates that both the baby T. rex and the young Allosaurus were getting their nourishment by drinking from the same teats of an adult female. This could be why the idea of the young dinosaurs looking up to their mother in wonder has been so popular in cartoons and

children's books for nearly 100 years. "It's a really surprising result and the key observation here is that they feed from the same mother," said Dr Philip Currie, the lead author of the research from the University of Alberta in Canada. "It could be why so many people have drawn dinosaurs as being quite similar to animals today. It's one of the reasons why people have been imagining that dinosaurs were quite motherly animals." The revelation has come after the authors - who describe their findings in the journal Nature - had to spend two years looking for an ancient baby Allosaurus fossil. Had

they found a fossilised baby T. rex, the identity of its mother would have been obvious. "In T. rex, it's actually very easy to tell who the mother is," said Dr Currie. "The baby T. rex is much smaller than the mother so you can tell which side is the mother and which side is the baby. "Whereas in Allosaurus it's a little bit more difficult. You'd think you might just be able to look at the belly and see who's getting milk from where, but you actually have to examine the skeleton and you have to take out certain bones to do it." Ancient beliefs The researchers believe that T. rex and Allosaurus were probably drinking their mother's

milk because they were mobile
