My name is Safa and I have been with Apple for more than 10 years. In the past, I have been a software engineer for OS X, a support engineer for iOS and iCloud and an evangelist. Currently, I work for the Connected car program at Apple. While I was employed at Apple, I was responsible for hardware support for our devices and software for the iCloud. In my spare time, I develop applications on the side. I have been working on apps related to OS X, iOS and iCloud for a while. I hope that you enjoy my posts.Q: Theta functions of the 1st kind We consider the 2×2 symmetric matrix $$ A = \begin{pmatrix} x\_1 & y\_1 \\ y\_1 & x\_2 \\ \end{pmatrix} $$ with coefficients $x\_i, y\_i \in \mathbb{R}$, i=1, 2.$ What do the (x_1, x_2)-Theta functions of the 1st kind, i.e. the functions $\Theta\_{A}(x\_1, x\_2)$, where $$ \Theta\_{A}(x\_1, x\_2) = \sum\_{k\_1, k\_2 \geq 0} x\_1^{k\_1} x\_2^{k\_2} $$ have? Here, the summation is over all $k\_1, k\_2 \in \mathbb{Z}$, and the entries of the matrix A are assumed to be non-zero. I've

The company's Productivity Suite now includes WhatsApp's data recovery software. WhatsApp has its own messaging app, "WhatsApp Messenger", and it looks an awful lot like the rival application. The new encryption feature, called Signal, was introduced in March 2016, so the similarities make sense. But they're not entirely similar -- for one thing, WhatsApp uses a mixture of secret keys to store its data, while Signal uses a single shared key that's connected to a remote storage center. Moreover, WhatsApp encrypts its data with a random key before sending the information. That's more of an edge case, and the primary difference between the two is the way they handle the decryption process. Signal encrypts your messages before sending them and encrypts them again once they arrive at your device. WhatsApp, on the other hand, has a physical "key for record," which is the only key used for decryption. When someone sends you a message, it's decrypted using that key; the key is stored in your device. So, each device has its own key to your messages stored on the cloud. It's an interesting concept, and it affords you a lot more privacy than the other way around. As Ryan Naraine, Signal's Director of Engineering, puts it: "You may encrypt your messages, you may send an encrypted message, but the cleartext is sent as plaintext to the end destination -- to the WhatsApp server." Here's how WhatsApp's decryption works. If you send a message to a friend on WhatsApp, you're using your device's SIM card. The encryption algorithm is called A5/1. Each message from you to your friend is encrypted with a random 256 bit AES key. The resulting data is then encrypted again with the device's key, which is derived from its own random 256 bit AES key. The resulting ciphertext is then embedded in an HTTP request. When you send the request to WhatsApp's server, that server will decrypt the ciphertext. The decrypted message is then stored in your inbox as a regular message. If the recipient calls WhatsApp and you hadn't started a conversation, the ciphertext is displayed as a yellow dot on the recipient's WhatsApp phone. Each device keeps its own key, but you won't be the only one with access. WhatsApp will "keep a copy of the key on the user's account with them on a secure remote server at " In b7e8fdf5c8

Here's how to do it: Select the downloaded file and install it. Launch the app after installation. On the main screen of the app you will be asked to enter your Google account credentials. If you don't have a Google account yet, you will also be asked to create one, which is now mandatory to be able to use Google Now on your smartphone. The app will then allow you to add your contacts and schedule notifications. The app will then ask you for your permission to access your contact's calendar. WhatsApp, the most popular instant messaging app in the world, has already seen more than 1 billion downloads until now. Thanks to the fast development of mobile technology, everybody could keep their friends close to them, no matter where they are, because there are always smart phones to make the communication easier. However, because WhatsApp's installation file is big, or could be even too big for some phones, it is very common for users to lose their data from the app and, even if they manage to backup everything before the disaster, it is still not easy to recover them. This is why they want to save WhatsApp backups, that are sorted and organized on Google Drive, so that they can easily access them and use them on another phone or computer if needed. All they have to do is to restore them through
